HOSE

DID YOU SERVICE THIS VEHICLE?

Do the right thing by your customers and use Gates Radiator Hose to reduce the risk of this happening to them.

Fit the Best

Gates hose has an EPDM patented formulation which is better equipped at handling the extreme temperatures generated by modern vehicles. By choosing Gates Radiator Hose you are providing a service to your customers that is proven to fight the primary cause of coolant hose failure, which is the effects of ECD* [electrochemical degradation].

Don't Risk It

A good service practice when replacing one coolant hose is to recommend the replacement of all other major cooling system hose at the same time. This is because ECD* affects the whole coolant hose system, and when one coolant hose fails or needs replacement there is a chance that the others will need replacing also.

*For more information on how ECD affects coolant hose, please visit the Gates website www.GatesAustralia.com.au

PREVENTIVE MAINTENANCE

COOLANT HOSE FAILS FROM THE INSIDE OUT

The primary cause of coolant hose failure is an electrochemical attack on the rubber compound in the hose.

This phenomenon is known as electrochemical degradation, or ECD. It occurs because the hose, liquid coolant and engine/radiator fittings form a galvanic cell or “battery”. This creates a chemical reaction which causes micro-cracks to form in the hose tube.

Coolant seeps into these cracks or stryations and begins to break down the reinforcement. This leads to hose failure and ultimately roadside breakdowns

An example of coolant hose failure caused by ECD.

PREVENTATIVE MAINTENANCE GUIDE

As there is no way to tell from a simple visual inspection if a hose has internal damage, Gates recommends that all cooling system hose should be inspected at least once a year for damage from the major hose enemies, including electrochemical degradation (ECD), heat, oil, abrasion, ozone and leakage.

The best way to check coolant hose for the effects of ECD is to squeeze the hose near the clamps or connectors using the following procedure:

1. Make sure the engine is cool.
2. Use fingers and thumb to check for weakness.
3. Squeeze near the clamps and connectors. ECD occurs within two inches of the ends of the hose - not in the middle (See image for correct position).
4. Check for any difference in the feel between the middle and ends of the hose. “Gaps,” or “channels,” can be felt along the length of the hose where it has been weakened by ECD. If the ends are soft and feel mushy, chances are, the hose is under attack by ECD.

To avoid the risk of a burst hose and a subsequent breakdown of the cooling system, Gates engineers recommend replacing the hose immediately.

COOLANT HOSE REPLACEMENT GUIDE

Pay special attention to hoses that have been in operation for four or more years. Hose failures increase dramatically after that period (see chart).

The best advice is to suggest replacement every four years for most vehicles. Vehicles operating under severe conditions may require more frequent replacements.

And remember, to prevent the risk of hose failure Gates recommends that if you are replacing one hose, that you should change all major cooling system hose at the same time.

WHEN TO REPLACE COOLANT HOSE:

- When you replace the water pump
- When you replace the thermostat
- Every four years of average driving
- Anytime you notice leakage or damage
